File No. 2009-050

200/a-056-F / 094-O-15/00

The Cretaceous sandstone consist of a very fine to fine sandstone with common glauconite and abundant occluding KAO clay. No visible porosity was observed in this formation.
The Debolt consist of a crinoidal packstone with poor porosity - minor intercrystalline porosity.

DST tests were performed over both the Cretaceous sandstone and Debolt and recovered mud only.
No evidence for the presence of fractures was observed.
